Chromaline Introduces New Chroma/Glo Specialty Inks

The Chromaline Corporation announces the introduction of new **Chroma/Glo Specialty Inks**. **Chroma/Glo** plastisol inks are specialty inks designed to give print projects a unique look. Customers can choose from Glow-in-the-Dark, PhotoChromatic, or ThermoChromatic inks.

Glow-in-the-Dark

Chroma/Glo Glow-in-the-Dark (GID) inks are a great choice whether trying to give an added "pop" to T-shirt prints or going for function in safety applications. Chroma/Glo GID inks are available in three grades ranging from standard economical to long-lasting supercharge - there's else like it on the market.

PhotoChromatic

Achieve dynamic prints with Chroma/Glo PhotoChromatic inks. PhotoChromatic inks are activated by sunlight, changing from clear to a bright color when exposed to sunlight. The color change is reversible. Colors will fade to clear quickly when hidden from outdoor light. Available in eight colors.

ThermoChromatic

Chroma/Glo ThermoChromatic inks are heat activated, causing the color to change when it reaches its activation temperature within +/-3 degrees. Color change is reversible when the printed area begins to cool. Chroma/Glo ThermoChromatic inks are available in twenty different colors and three different activation grades.

For more information and sizes available, call The Chromaline Corporation at **1-800-328-4261**.

The Chromaline Corporation is a Duluth, Minnesota based developer, manufacturer and worldwide marketer of photochemical imaging systems for the screen printing industry.
